Next, let's actually look at how we represent a cube of fluid. We're going to need its size (this code only handles perfect cubes which have the same length on each size), the length of the timestep, the amount of diffusion (how fast stuff spreads out in the fluid), and the viscosity (how thick the fluid is).

A Absolute electrode potential In electrochemistry, according to an IUPAC definition, is the electrode potential of a metal measured with respect to a universal reference system (without any additional metal-solution interface). Absolute pressure Is zero-referenced against a perfect vacuum, using an absolute scale, so it is equal to gauge pressure plus atmospheric pressure.

A new paper in Nature Climate Change by Santer et al. claims that the 40 year record of global tropospheric temperatures agrees with climate model simulations of anthropogenic global warming so well that there is less than a 1 in 3.5 million chance (5 sigma, one-tailed test) that the agreement between models and satellites is just by chance.. And, yes, that applies to our (UAH) dataset as well.
