Janus particles are special types of nanoparticles or microparticles whose surfaces have two or more distinct physical properties. This unique surface of Janus particles allows two different types of chemistry to occur on the same particle. The simplest case of a Janus particle is achieved by dividing the particle into two distinct parts, each of them either made of a different material, or ...

Tungsten carbide (chemical formula: WC) is a chemical compound (specifically, a carbide) containing equal parts of tungsten and carbon atoms. In its most basic form, tungsten carbide is a fine gray powder, but it can be pressed and formed into shapes through a process called sintering for use in industrial machinery, cutting tools, abrasives, armor-piercing rounds, other tools and instruments ...

installed on site, though premanufactured systems are available. Polyurethane surfaces may be colored or black. There are four types. The basic polyurethane-bound system consists of rubber particles bound with polyurethane to form a base mat.

Hansen solubility parameters (HSPs) are useful to evaluate the compatibility of functional particles in a liquid phase. Until now, sedimentation velocity and dynamic light scattering (DLS) methods have been used to measure the HSPs of particle surfaces.

Roof Guardian Technologies (RGT), which has been on the market for over 15 years, has 2 Cool Roof Rated, EPA, VOC compliant, liquid applied, elastomeric systems for use in restoring and prolonging the life of not only metal roofs, but also smooth surfaced BUR, polymer modified asphalt and single ply roof systems.

In the early 19th century, the English scientist Thomas Young carried out the famous double-slit experiment which demonstrated that a beam of light, when split into two beams and then recombined, will show interference effects that can only be explained by assuming that light is a wavelike disturbance. By 1820, Augustin Fresnel had put this theory on a sound mathematical basis, but the exact ...

Detect and measure 3D particles with BoneJ. Particle Analyser. This plugin performs connected-components labelling. It started life as an adaptation of the 3D Object Counter, for identifying particles as part of Purify. Once it became obvious that the heavily recursive algorithm was very inefficient, especially on large stacks, particle labelling was rewritten to be multithreaded and much less ...

There are about 7,000 photographs of particles on this site. I have started a guide to these particles

to aid in identification. By clicking on the particle showing the feature of interest it will carry you to the next level with a number of additional particles that have similar features.

Core-shell particles are usually synthesized by a two-step or multiple-step process. The core particles are synthesized first and the shell is then formed on the core particle via different methods, depending on the type of core and shell materials and their morphologies. Core-shell nanoparticles have been mostly investigated, compared to core-shell microspheres.
